

Speaker 1

So, what I can assert, from how it is destroyed, based on our places.

So one, climate is affected by road constructions, like means of transport.

In a way of making transport. You can see here, after constructing the road, where they are acquiring wood it is destroying the environment.

Another one.

This is for oil, for pipeline transport.

Yeah, it's saying that the East African crude oil pipeline under construction, so they're constructing.

The impact here is the negative one.

They leave holes after leaving the holes obviously.

After like, really digging these holes, what will take place is soil erosion.

Then here you saw it being carried down together with some vegetation sliding down in the land there.
